The Grand Design Stephen Hawking 2010-09-07
#1 NEW YORK TIMES BESTSELLER When and how did the universe begin? Why are we here? What is the nature of reality? Is the apparent “grand design” of our universe evidence of a benevolent creator who set things in motion—or does science offer another explanation? In this

startling and lavishly illustrated book, Stephen Hawking and Leonard Mlodinow present the most recent scientific thinking about these and other abiding mysteries of the universe, in nontechnical language marked by brilliance and simplicity. According to quantum theory, the cosmos does not have just a single existence or history. The authors explain that we ourselves are the product of quantum fluctuations in the early universe, and show how quantum theory predicts the “multiverse”—the idea that ours is just one of many universes that appeared spontaneously out of nothing, each with different laws of nature. They conclude with a riveting assessment of M-theory, an explanation of the laws governing our universe that is currently the only viable candidate for a “theory of everything”: the unified theory that Einstein was looking for, which, if confirmed, would represent the ultimate triumph of human reason.

Technologies in the Era of Singularity Guru Pada Chattopadhyay 2018-05-28 When young, we didn't have cellular devices but communicated through handwritten letter. We walked miles to school, in the sun and the rain. It's mind-boggling to think how far we've come technologically.

"Objects in mirror are closer than they appear." That familiar warning applies to the windshield, not the rear view mirror when it comes to technology. And in case of exponential technologies, almost everything is closer than it appears. Today's students will be graduating in and around 2030. Over 65% of the jobs of that time have not been invented yet. What knowledge, skills and dispositions will our learners need for a successful future? How will exponential changes in technology influence them? How can they shape the future instead of being shaped by it? There is an urgent need to be aware of exponential technologies which will usher in singularity, a point in time when artificial intelligence will equal and then surpass biological intelligence. An exploratory design of medical nanotechnology and robotics is creating mechanical artificial red blood cells, called respirocytes, which will deliver 236 times more oxygen to the tissues per unit volume. One can then do an Olympic sprint in fifteen minutes

without taking a breath. Earth is awash with the sun's rays carrying 10,000 times more energy than we need but we cannot harness it. In a foreseeable future, highly efficient, lightweight, nano-engineered solar panels will be able to store solar energy in distributed nanotechnology-based fuel cells. In the field of health, we are going to have tools to reprogram biology to block diseases and delay aging. We need our future scientists and engineers to be wholesome human beings with the ability to think critically and pay heed to the moral and ethical issues of future technologies. Notwithstanding these issues, all great technological breakthroughs are absolutely necessary to alleviate poverty, disease, suffering and create abundance.

The CD-ROM Drive Sorin G. Stan 2013-06-29 The Compact Disc (CD), as a standardized information carrier, has become one of the most successful consumer products ever marketed. Although the original disc was intended for audio playback, its specific advantages opened very quickly the way towards various computer applications. The standardization of the Compact Disc Read-Only Memory (CD-ROM) and of all succeeding similar products, like Compact Disc interactive (CD-i), Photo and Video CD, CD Recordable (CD-R), and CD Rewritable (CD R/W), has substantially enlarged the range of possible applications. The plastic disc represented from the very beginning a removable medium of large storage capacity. The advent of the personal computer accompanied by the increasing demand for both data distribution and exchange have strongly marked the evolution of the CD-

ROM drive. The number of sold CD-ROM units exceeded 60 millions in 1997 when compared to about 2.5 millions in 1992. As computing power continuously improved over the years, computer peripherals have also targeted better performance specifications. In particular, the speed of CD-ROM drives increased from the so-called 1X in 1984 to double speed in 1992, and further to 32X at the beginning of 1998. The average time needed to access data on disc has dropped from about 300 ms to less than 90 ms within the same period of time.
